

# Governance issues for the Reconstruction of the Science and Technology Policy System

TOKYO FOUNDATION FOR POLICY RESEARCH INTERNATIONAL WEBINAR  
on “Science and Technology Policy at a Turning Point,” Feb 17, 2022,  
Session 1: “Cross-sectoral Governance of Emerging Technologies” (10:00–11:15)

**Makiko Matsuo** 松尾 真紀子

**Hideaki Shiroyama** 城山 英明: **Principal Investigator**

THE TOKYO FOUNDATION  
FOR POLICY RESEARCH

# Environment Surrounding Emerging Technology

---

- Increasing importance of ST in face of **Grand Challenges**
  - Climate change, pandemic, ST plays great role
- Appearance of emergence of new technologies (AI, IoT, biotechnology etc), with unprecedented speed in advancement
- Broad, ambiguous and uncertain social impact→increasing complexity, interrelatedness, systematic effects
- ST's promotion must be balanced with its social impact
  - Increasing recognition of “innovation” aspect
  - Social demand for accountability, consideration of ELSI

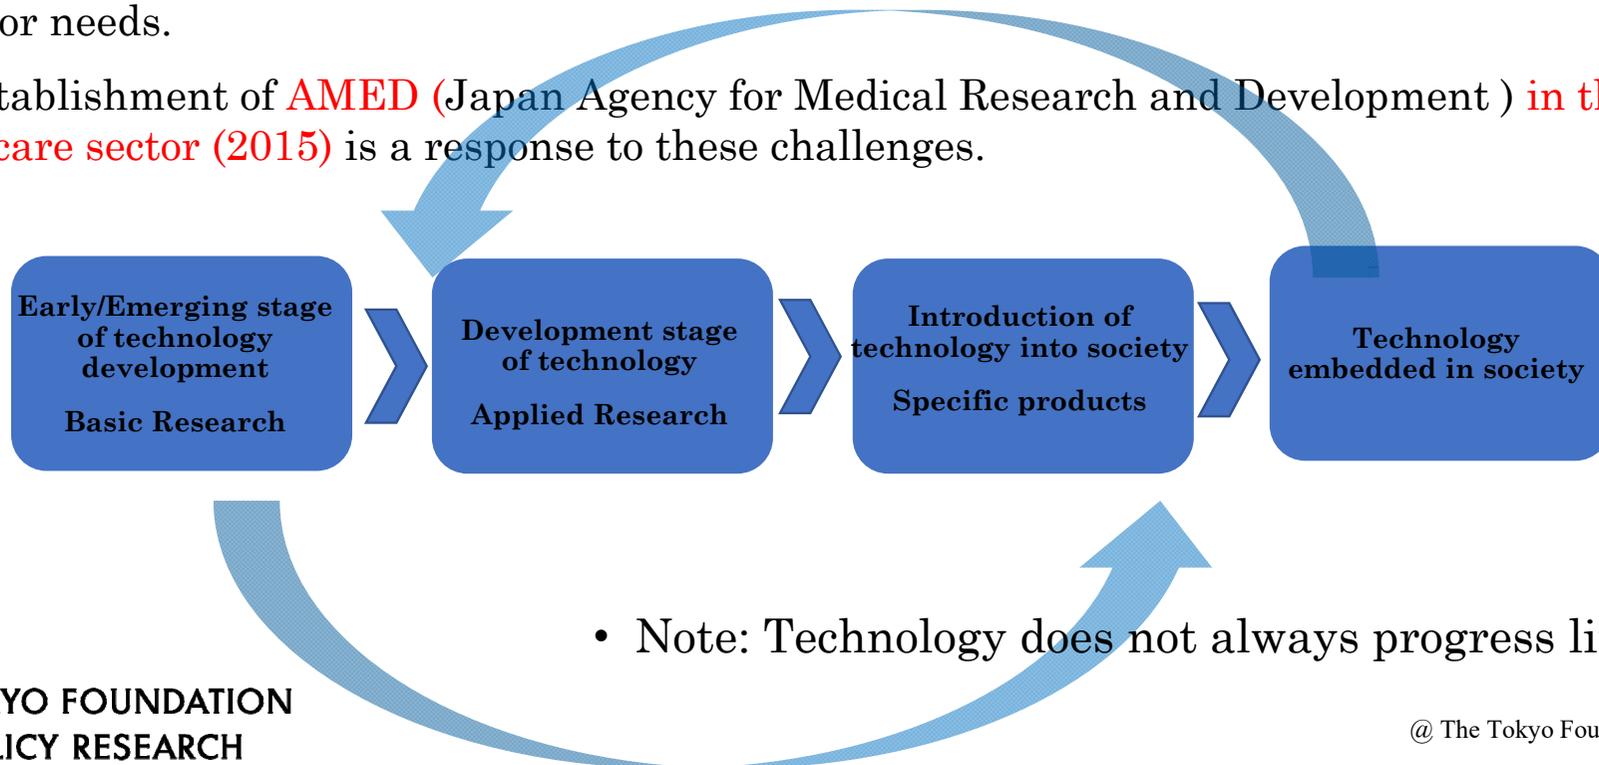

# Can current STI policy respond to changing environment?

---

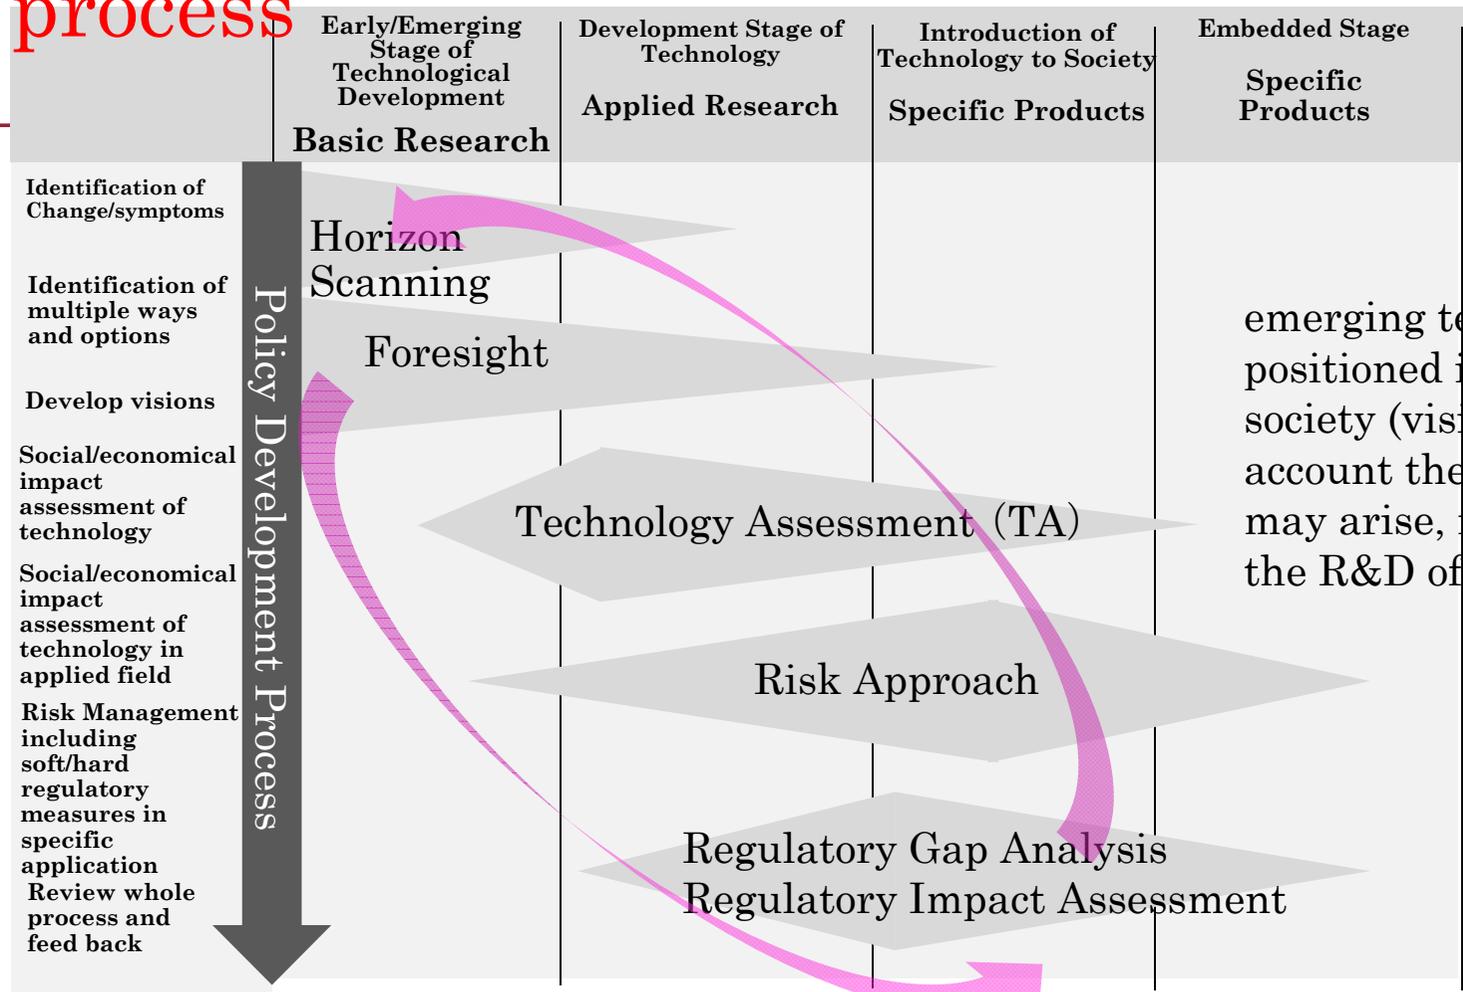

- Limits in responding due to **3 STI governance deficits**
  - ① **Shortsighted**: focused on immediate short-term interest, evident risks)
  - ② **Siloed**: Sectionalism, lack of collaboration with different fields/sectors, pursuit of partial optimization )
  - ③ **Fixed**: institution strongly build in a path dependent manner, resist response to change)
- The characteristics of current ST governance may work efficiently for the issues that have limited impact and known, but not for most issues we are facing today.

# Fragmentation of the process and actors of social introduction of emerging technologies

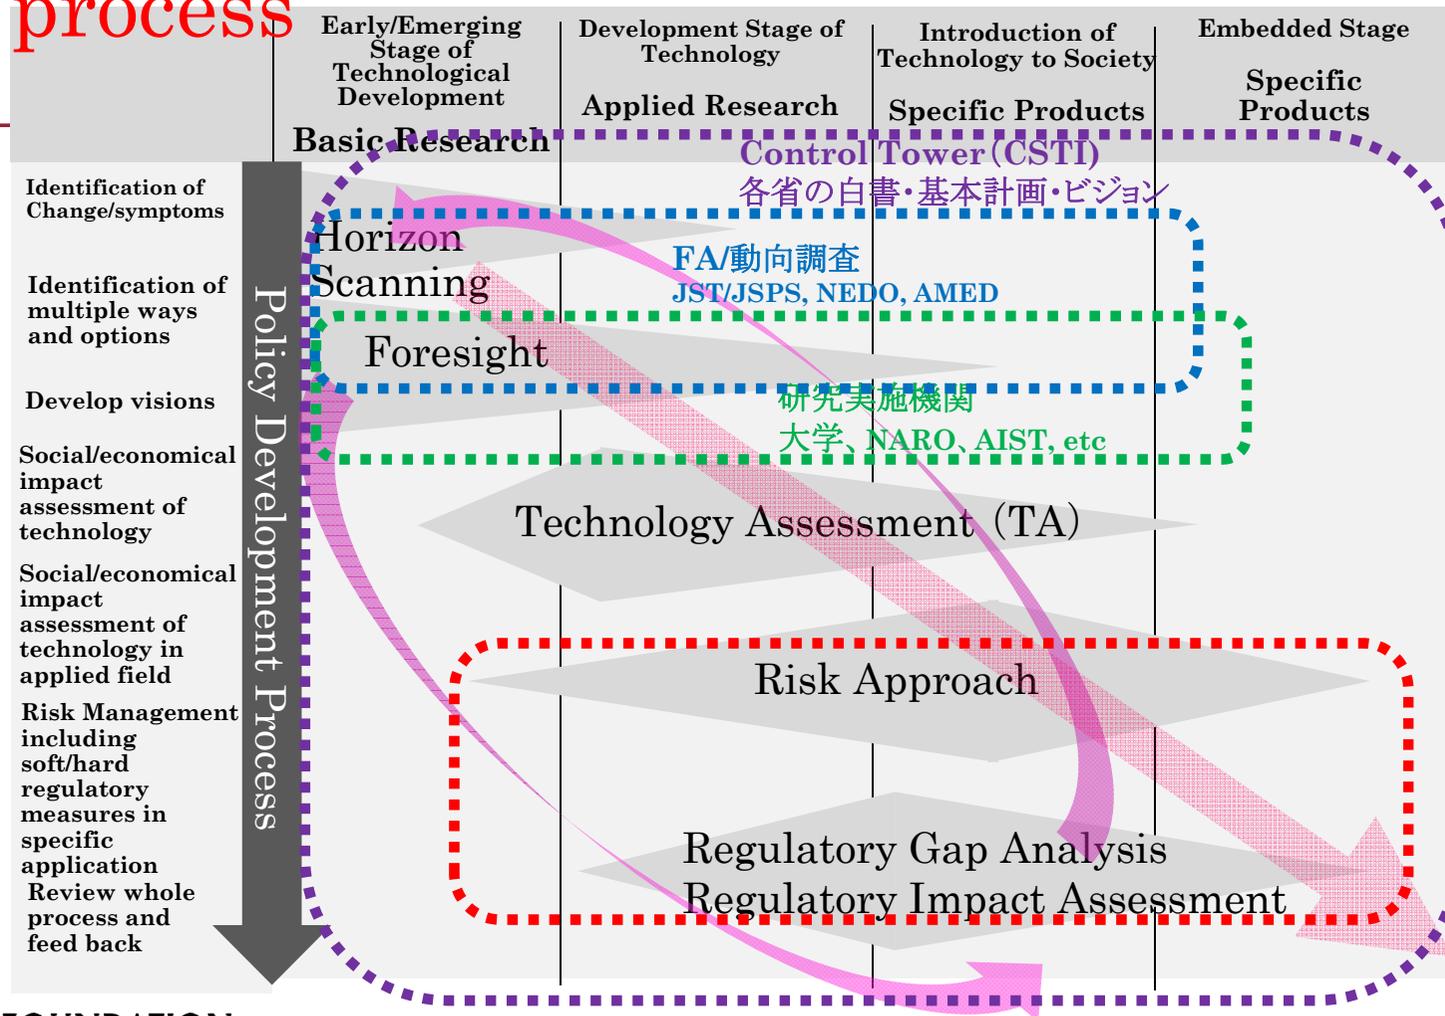

- **Different policy actors in different sectors** are in charge of basic research, applied research, and social introduction. No seamless flow from basic research to social introduction (cf. case of biotech).
- the results of basic research are not passed on, or no feedback to basic research from the societal lesson or needs.
- The establishment of **AMED (Japan Agency for Medical Research and Development)** in the **healthcare sector (2015)** is a response to these challenges.

# Need for coordination of various policy tools in policy process

# Need for coordination of various policy tools in policy process

# What is needed for our policy and institution – Governance

---

- **3 governance deficits (all are interrelated)**
  - ① shortsighted → **Long term, forward looking app**
  - ② siloed → **meta, holistic, whole-of-government app.**
  - ③ fixed → **flexible, responsive app.**
- Need to keep in mind, there is no perfect approach, every approach can have merit and demerit.

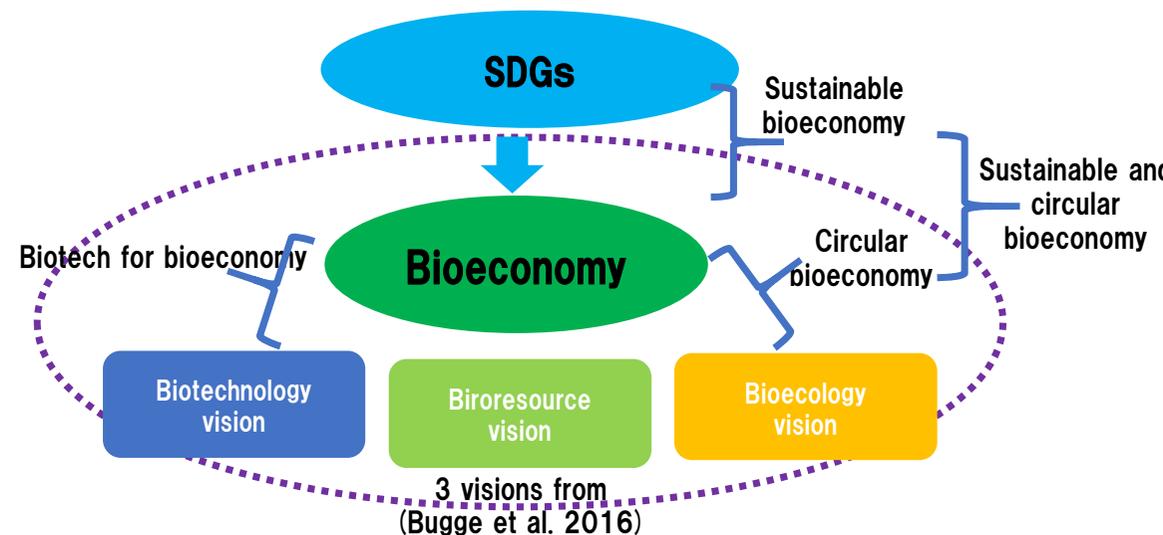

# ① Introduction of long-term and forward looking app in policy process

---

- Introduce a mechanism in policy process to form long-term vision (from early to late stage) in priority issue domains
  - Promote collaboration between existing foresight and HS activities
    - a. We do have foresight and HS : **promote collaboration/exchange of info** between existing foresight and HS (MEXT NISTEP, METI NEDO), strengthen social aspect in their analysis, make sure to ensure different multiple paths in foresight
  - **Seamlessly connect long-term vision, foresight, and social implementation**
    - a. Consider **institutional design** that seamlessly connect R&D to implementation including its oversight and regulation
    - b. Make sure to consider **safety, regulatory science and ELSI from the outset**. Embed **RRI from the early stage** together with the researchers and developers to avoid “pacing problem”
- Cf. Lack of long-term perspective in policy making may due to the Japanese bureaucratic system (generalists vs specialist)

## ② Introduce mechanism to ensure **holistic app** in policy issues

- Need for a Holistic/meta and multi-level analysis
  - a. Need for a **Holistic/meta app in policy issue**: interrelatedness, trade offs
    - Importance of cross-sector, jurisdiction etc had always been acknowledged
      - Cf. need to reconsider coordination and control tower function?
  - b. Need for a **multi-level perspective (Transition management)**
    - Need to be aware of overall trend and landscapes, changing environment, international relations and niche in addition to policy sphere.

## ③introduce a mechanism that allows **flexibility to policy system**

---

- Consideration of approaches that enables **flexibility and responsiveness in responding to uncertainty**
- a. Can we learn lessons from **the (planned) adaptive governance, agile governance, reflexive governance, experimentation** etc?
  - The concept of agility is appealing in face of unchanging inflexibility and rigidity
    - How can we exactly utilize this concept in real policy?
    - What needs to be taken care of in using it? (ex, agility may inherently conceptually conflict with stability)
- b. Need for **information and evidence gathering mechanism**
  - In order to make change/rule, (new) information and evidence is needed but difficult in case of emerging tech
    - What kind of mechanism can be considered? (public-private-partnership work?)
    - **Voluntary (consultation) mechanism? (cf. notification procedure in japan for the genome edited food)**

# Cf. Notification procedure for genome edited food in Japan

---

- Way to keep pace with technology?
- Regulatory clarification of genome-editing for food use
  - Certain genome-edited product (considered to pose same level of risk as conventional breeding, SDN1, SDN2 case-by-case) was exempted from the GM regulation
  - Set in place a mechanism
    - to ensure prior consultation to accumulate information, monitor (and for consumer confidence),
    - Information of products not under the regulation also made available to public
    - Labelling is **not mandatory** but Consumer Agency encourage developers to provide information on notified products

# What role for government and policy maker in STI?

---

- Making Strategy?
- Rule and norm making?
- Multi-level, policy coordination and process management (OECD, 2018)?
- matching function?

# Annex: Japan's AI Governance

---

<Long-term and forward looking?>

- Society 5.0 as social vision? - main focus on integrated technologies of physical space and cyber space such as IOT + mention about social inclusion (everyone including women and elderly can be active)
- Discussion of use cases (autonomous vehicles, fin-tech, medical devices, work-life balance, etc.) for guideline development

<Holistic?>

- Discussion at the level of ministries and cabinet level- various benefits and risks (safety, security, ethics) – de fact TA (Technology Assessment)?
- Parallel development of domestic and international discussion (G7, G20, OECD, WTO, TPP, etc.)

<Flexibility and adaptation?>

- Main focus on non-regulatory measures (soft law) ⇔EU
- Extensive roles of self regulations
- AI policy as a tool for regulatory reform (governance innovation) crosscutting traditional sectors cf. METI Data Contract Guideline Jun 2018
- New type of regulation ex. approval of medical machine using AI
